

## Editorial

It is my great pleasure to welcome you to the inaugural issue of the Communication in Biomathematical Sciences. This journal which is endorsed by the Indonesian Biomathematical Society is meant to accommodate the fast growing research and interest in Biomathematical fields in the region.

The aim of the journal is to facilitate and to promote the recent progress and development in biomathematical sciences. The research fields include (but not limited to) infectious disease modelling and related dynamical system, population dynamics, biostatistics and bioinformatics.

Communication in Biomathematical Sciences welcomes research articles in the area of Biomathematical fields. Review papers which describe current development of important topics are also welcome. Applied mathematicians working in related biological problems and phenomena as well as biologists and other related disciplines who are working with mathematical modelling are invited to submit articles. Articles focusing on problem solving of real world problems using field data, and on specific problem with local characteristic are very much appreciated.

For this first issue, I would like to thank our excellent editorial board for their support to the journal. I am looking forward to receiving manuscripts for peer review and any comments or suggestions for improvement of this early publication of the journal are very much appreciated.
