**Abstract.** In this paper, we give a generalization of slightly compressible modules. We introduce the notion of  $M$ -slightly compressible modules, i.e. a right  $R$  module  $N$  is called  $M$ -slightly compressible if for every nonzero submodule  $A$  of  $N$  there exists a nonzero  $R$ -homomorphism  $s$  from  $M$  to  $N$  such that  $s(M) \hookrightarrow A$ . Many examples of  $M$ -slightly compressible modules are provided. Some results on  $M$ -slightly compressible modules are obtained, which are interesting and important.

**Keywords:** compressible modules;  $M$ -slightly compressible modules; slightly compressible modules.

**AMS Subject Classification:** 16D10, 16D50

### 1 Introduction and Preliminaries

Throughout this paper,  $R$  is an associative ring with identity and  $\text{Mod-}R$  is the category of unitary right  $R$ -modules. For a right  $R$ -module  $M$ , let  $S = \text{End}R(M)$  be the endomorphism ring of  $M$ . A right  $R$ -module  $N$  is called  $M$ -generated if there exists an epimorphism  $M^{(I)} \rightarrow N$  for some index set  $I$ . If  $I$  is finite, then  $N$  is called finitely  $M$ -generated. In particular,  $N$  is called  $M$ -cyclic if it is isomorphic to  $M / L$  for some submodule  $L$  of  $M$  or equivalent to saying that any  $M$ -cyclic submodule  $X$  of  $M$  can be considered the image of an endomorphism of  $M$ . Following Wisbauer [1],  $\sigma[M]$  denotes the full subcategory of  $\text{Mod-}R$  whose objects are submodules of  $M$ -generated modules. A right  $R$ -module  $M$  is called a self-generator if it generates all of its submodules. A right  $R$ -module  $M$  is called a subgenerator if it is a generator of  $\sigma[M]$ . For undefined notation, terminology and all the basic results on rings and modules see [1-3].

In 1976, Zelmanowitz [4] introduced the notion of compressible modules. A right  $R$ -module  $M$  is called *compressible* if for each nonzero submodule  $N$  of  $M$

there exists an  $R$ -module monomorphism from  $M$  to  $N$ . For example, if  $R$  is a domain, then the right  $R$ -module  $R$  is compressible. Generalizations of compressible modules have been studied in several papers (see [5-7]). Recently, P.F. Smith [8] introduced the concept of a slightly compressible module, which is a generalization of the compressible module. According to P.F. Smith, a right  $R$ -module  $M$  is called *slightly compressible* if for any nonzero submodule  $N$  of  $M$  there exists a nonzero  $R$ -module homomorphism from  $M$  to  $N$ . See for example [8], Example 1.2: if  $S$  is a nonzero ring and  $R$  is the ring of  $2 \times 2$  upper triangular matrices over  $S$ , then the right  $S$ -module  $R$  is slightly compressible.

In this paper, the notion of  $M$ -slightly compressible modules where  $M$  is a right  $R$ -module is introduced and studied, which is a general form of slightly compressible modules. Moreover we provide conditions for any right  $R$ -module to be an  $M$ -slightly compressible module and an example of  $M$ -slightly compressible modules. Some results on slightly compressible modules [8] are extended to  $M$ -slightly compressible modules.

## 2 $M$ -slightly Compressible Modules

In this section, we introduce the concept of  $M$ -slightly compressible modules. We investigate the basic properties of  $M$ -slightly compressible modules. Some of these properties are analogous to the properties of slightly compressible modules. First, we give the following definition:

**Definition 2.1** Let  $M$  and  $N$  be right  $R$ -modules.  $N$  is called  $M$ -slightly compressible if for every nonzero submodule  $A$  of  $N$  there exists a nonzero  $R$ -homomorphism  $s$  from  $M$  to  $N$  such that  $s(M) \hookrightarrow A$ . In the case that  $M = N$ ,  $N$  is called a *slightly compressible module*, referring to [8].

### Example 2.2

- (1) This example is taken from [9]. A right  $R$ -module  $N$  is called *fully- $M$ -cyclic* if for every submodule  $A$  of  $N$  there exists  $s \in \text{Hom}_R(M, N)$  such that  $A = s(M)$ . A right  $R$ -module  $M$  is called *quasi-fully-cyclic* if it is a fully- $M$ -cyclic module. It is clear that every fully- $M$ -cyclic module is an  $M$ -slightly compressible module.
- (2) Let  $M$  and  $N$  be right  $R$ -modules. If  $N$  is an  $M$ -generated module, then  $N$  is an  $M$  slightly compressible module (see, [[3], Exercise 2(b) and (d), pp. 361-362]).

- (3) Let  $F$  be a field and  $R = \begin{pmatrix} F & F \\ 0 & F \end{pmatrix}$  the ring of all matrices of the form  $\begin{pmatrix} a & b \\ 0 & c \end{pmatrix}$  where  $a, b, c \in F$ ,  $M_R = \begin{pmatrix} F & F \\ 0 & F \end{pmatrix}$  and  $N_R = \begin{pmatrix} 0 & F \\ 0 & 0 \end{pmatrix}$ . Then,  $M_R$  and  $N_R$  are  $R_R$ -slightly compressible modules.

**Theorem 2.3** Let  $M$  be a Noetherian right  $R$ -module. If  $N$  is an  $M$ -slightly compressible module, then  $\text{Soc}(M) \cong \text{Soc}(N)$ .

**Proof.** Assume that  $N$  is an  $M$ -slightly compressible module. Let  $A$  be a simple submodule of  $N$ . There exists  $0 \neq s \in \text{Hom}_R(M, N)$  such that  $0 \neq s(M) \hookrightarrow A$ . But  $A$  is a simple submodule of  $N$ ,  $A = s(M)$ . Let  $0 \neq a \in A$ . Then,  $aR = A = s(M)$ , so  $a = s(b)$  for some  $b \in M$ . In Noetherian module  $bR$ , there exists a simple submodule  $B$  containing  $b$  such that  $A \cong B$ . Therefore  $\text{Soc}(M) \cong \text{Soc}(N)$ .

**Theorem 2.4** Let  $M, M'$  and  $N$  be right  $R$ -modules, where  $N$  is an  $M$ -slightly compressible module.

- (1) If  $M$  is an epimorphism image of  $M'$ , then  $N$  is an  $M'$ -slightly compressible module.
- (2) If  $M$  is an  $M'$ -slightly compressible module, then  $N$  is also an  $M'$ -slightly compressible module.
- (3) For any submodule  $A$  of  $N$ ,  $A$  is an essential in  $N$  if and only if for any  $0 \neq t \in \text{Hom}_R(M, N)$ ,  $t(M) \cap A \neq 0$ .
- (4) For any submodule  $A$  of  $N$ ,  $A$  is a uniform submodule of  $N$  if and only if for any  $0 \neq t \in \text{Hom}_R(M, A)$ ,  $t(M)$  is an essential in  $A$ .

**Proof.**

- (1) Assume that  $M$  is an epimorphism image of  $M'$ . There exists an epimorphism  $\alpha$  from  $M'$  to  $M$ , so  $\alpha(M') = M$ . Let  $0 \neq A \hookrightarrow N$ . Since  $N$  is an  $M$ -slightly compressible, there exists  $0 \neq s \in \text{Hom}_R(M, N)$  such that  $s(M) \hookrightarrow A$ . Thus  $s\alpha(M') \hookrightarrow A$ . Therefore  $N$  is an  $M'$ -slightly compressible module.
- (2) Assume that  $M$  is an  $M'$ -slightly compressible module. Let  $0 \neq A \hookrightarrow N$ . Since  $N$  is an  $M$ -slightly compressible module, there exists  $0 \neq s \in \text{Hom}_R(M, N)$  such that  $s(M) \hookrightarrow A$ . Because  $M$  is an  $M'$ -slightly compressible module, there exists  $0 \neq t \in \text{Hom}_R(M', M)$  such that  $t(M') \hookrightarrow M$ . Then,  $st(M') \hookrightarrow s(M) \hookrightarrow A$ . Thus  $N$  is an  $M'$ -slightly compressible module.
- (3)  $(\Rightarrow)$  It is obvious.

( $\Leftarrow$ ) Assume that any  $0 \neq t \in \text{Hom}_R(M, N)$ ,  $t(M) \cap A \neq 0$  holds. Let  $0 \neq B \hookrightarrow N$ . Since  $N$  is an  $M$ -slightly compressible module, there exists  $0 \neq s \in \text{Hom}_R(M, N)$  such that  $s(M) \hookrightarrow B$ . Thus  $s(M) \cap A \neq 0$  and we have  $B \cap A \neq 0$ . Therefore  $A$  is an essential in  $N$ .

(4) ( $\Rightarrow$ ) It is clear.

( $\Leftarrow$ ) Assume that for any  $0 \neq s \in \text{Hom}_R(M, A)$  such that  $t(M)$  is an essential in  $A$ . Let  $B$  and  $C$  be nonzero submodules of  $A$ . Since  $N$  is an  $M$ -slightly compressible module, there exists  $u, v \in \text{Hom}_R(M, N)$  such that  $0 \neq u(M) \hookrightarrow B$  and  $0 \neq v(M) \hookrightarrow C$ . By assumption we have  $u(M)$  and  $v(M)$  are essential in  $A$ . Then,  $u(M) \cap v(M) \neq 0$  and we have  $B \cap C \neq 0$ . Therefore  $A$  is uniform.

**Proposition 2.5** Let  $M$  and  $N$  be right  $R$ -modules such that  $\text{Hom}_R(M, N) \neq 0$ . Then,  $N$  is a simple module if and only if  $N$  is an  $N$ -slightly compressible module with every nonzero  $R$ -homomorphism from  $M$  to  $N$  is an epimorphism.

**Proof.**

( $\Rightarrow$ ) It is obvious.

( $\Leftarrow$ ) Assume that  $N$  is an  $M$ -slightly compressible module with every nonzero  $R$ -homomorphism from  $M$  to  $N$  is an epimorphism. Let  $0 \neq A \hookrightarrow N$ . There exists  $0 \neq s \in S = \text{Hom}_R(M, N)$  such that  $0 \neq s(M) \hookrightarrow A$ . By assumption we have  $N = s(M)$  and hence  $N = A$ . Therefore  $N$  is a simple module.

**Corollary 2.6** ([10], Proposition 3.5) Let  $M$  be a right  $R$ -module. Then,  $M$  is a simple module if and only if  $M$  is a slightly compressible module with every nonzero endomorphism of  $M$  is an epimorphism.

**Proposition 2.7** Let  $N$  be an  $M$ -slightly compressible module. Then,

- (1)  $A$  is an  $M$ -slightly compressible module for all  $A \hookrightarrow N$ .
- (2)  $N$  is an  $P$ -slightly compressible module for every right  $R$ -module  $P$  with  $\ker(s) \neq P \hookrightarrow M$  for all  $s \in \text{Hom}_R(M, N)$ .

**Proof.**

- (1) Let  $A \hookrightarrow N$ . If  $A = 0$ , it is clear. We can suppose that  $A \neq 0$ . Let  $0 \neq B \hookrightarrow A$ . Then,  $B \hookrightarrow N$  and there exists  $0 \neq s \in \text{Hom}_R(M, N)$  such that  $s(M) \hookrightarrow B$ . Thus,  $0 \neq s \in \text{Hom}_R(M, A)$ . Hence,  $A$  is an  $M$ -slightly compressible.
- (2) Let  $P \hookrightarrow M$  such that  $\ker(s) \neq P$  for all  $s \in \text{Hom}_R(M, N)$ . Let  $A \neq 0 \hookrightarrow N$ . Since  $N$  is an  $M$ -slightly compressible module, there exists  $0 \neq s \in$

$\text{Hom}_R(M, N)$  such that  $s(M) \hookrightarrow A$  and  $\ker(s) \neq P$ . Then,  $0 \neq s|_P \in \text{Hom}_R(P, N)$  such that,  $s|_P(P) \hookrightarrow A$ , where  $s|_P$  is an  $R$ -homomorphism with respect to  $P$ . Therefore  $N$  is an  $P$ -slightly compressible.

**Proposition 2.8** Let  $M$  and  $N$  be right  $R$ -modules. If every nonzero submodule  $A$  of  $N$  containing nonzero submodule  $B$  such that  $B \cong C$  where  $C$  is a direct summand of  $M$ , then  $N$  is an  $M$ -slightly compressible module.

**Proof.** Assume that every nonzero submodule  $A$  of  $N$  containing nonzero submodule  $B$  such that  $B \cong C$  where  $C$  is a direct summand of  $M$ . Let  $0 \neq A \hookrightarrow N$ . By assumption there exists a nonzero submodule  $B$  such that  $B \cong C$  where  $C$  is a direct summand of  $M$ . Since  $B \cong C$  there exists a  $\alpha$  that is an isomorphism from  $C$  to  $B$ . Let  $\pi_C$  be the canonical projection map from  $M$  to  $C$ . Thus,  $\alpha\pi_C: M \rightarrow B$  is an  $R$ -homomorphism and  $\alpha\pi_C(M) \hookrightarrow A$ . Therefore  $N$  is an  $M$ -slightly compressible module.

Recall that  $P \in \sigma[M]$  is called *hereditary* in  $\sigma[M]$  if every submodule of  $P$  is a projective in  $\sigma[M]$ . We say that a ring  $R$  is *right (left) hereditary* if  $R_R ({}_R R)$  is a hereditary in  $\text{Mod-}R$ .

**Theorem 2.9** Let  $R$  be a right hereditary ring and  $M$  an injective right  $R$ -module. If  $N$  is an  $M$ -slightly compressible module, then every nonzero submodule  $A$  of  $N$  contains a direct summand of  $N$ .

**Proof.** Assume that  $N$  is an  $M$ -slightly compressible module. Let  $0 \neq A \hookrightarrow N$ . By assumption there exists  $0 \neq s \in \text{Hom}_R(M, N)$  such that  $s(M) \hookrightarrow A$ . Since  $M$  is an injective module,  $R$  is a hereditary ring and Theorem 3.22 in [11],  $M|_{\ker(s)}$  is an injective. But  $M|_{\ker(s)} \cong s(M)$ ,  $s(M)$  is an injective. Therefore  $s(M)$  is a direct summand of  $N$ .

**Proposition 2.10** Let  $M$  and  $N$  be right  $R$ -modules such that  $N$  is an  $M$ -slightly compressible module. If every  $M$ -cyclic submodule of  $N$  is an injective module, then  $N$  is an  $M$ -generated module.

**Proof.** Assume that every  $M$ -cyclic submodule of  $N$  is an injective. Let  $0 \neq A \hookrightarrow N$ . There exists  $0 \neq s \in \text{Hom}_R(M, N)$  such that  $0 \neq s(M) \hookrightarrow A$ . By assumption  $s(M)$  is an injective and we have  $s(M)$  is a direct summand of  $A$ . There exists  $B \hookrightarrow A$  such that  $s(M) \oplus B = A$ . If  $B = 0$ , we are done. If  $0 \neq B \hookrightarrow N$ , there exists  $0 \neq t \in \text{Hom}_R(M, N)$  such that  $0 \neq t(M) \hookrightarrow B$ . By assumption,  $t(M)$  is an injective and we have  $t(M)$  is a direct summand of  $B$ . Thus, there exists  $C \hookrightarrow B$  such that  $t(M) \oplus C = B$ . Continuous in this process we have  $A = \sum_{s \in \text{Hom}_R(M, N)} s(M)A$ . Therefore  $N$  is an  $M$ -generated module.

**Corollary 2.11** Let  $M$  be a slightly compressible module. If every  $M$ -cyclic submodule of  $M$  is an injective then  $M$  is a self-generator.
